

## Section 5-3 Binomial Probability Distributions

---

---

---

---

---

---

---

---

### Binomial Probability Distribution

A **binomial probability distribution** results from a procedure that meets all the following requirements:

1. The procedure has a **fixed number of trials**.
2. The trials must be **independent**. (The outcome of any individual trial doesn't affect the probabilities in the other trials.)
3. Each trial must have all outcomes classified into **two categories** (commonly referred to as **success** and **failure**).
4. The probability of a success remains the same in all trials.

---

---

---

---

### Notation for Binomial Probability Distributions

**S** and **F** (success and failure) denote the two possible categories of all outcomes; ***p*** and ***q*** will denote the probabilities of **S** and **F**, respectively, so

$$P(S) = p \quad (p = \text{probability of success})$$

$$P(F) = 1 - p = q \quad (q = \text{probability of failure})$$

---

---

---

## Notation (continued)

- $n$**  denotes the fixed number of trials.
- $x$**  denotes a specific number of successes in  $n$  trials, so  $x$  can be any whole number between 0 and  $n$ , inclusive.
- $p$**  denotes the probability of **success** in **one** of the  $n$  trials.
- $q$**  denotes the probability of **failure** in **one** of the  $n$  trials.
- $P(x)$**  denotes the probability of getting exactly  $x$  successes among the  $n$  trials.

---

---

---

---

---

---

---

---

---

---

## Method 1: Using the Binomial Probability Formula

$$P(x) = \frac{n!}{(n-x)!x!} \cdot p^x \cdot q^{n-x}$$

for  $x = 0, 1, 2, \dots, n$

where

- $n$**  = number of trials
- $x$**  = number of successes among  $n$  trials
- $p$**  = probability of success in any one trial
- $q$**  = probability of failure in any one trial ( $q = 1 - p$ )

---

---

---

---

---

---

---

---

---

---

## Method 2: Using Technology

STATDISK, Minitab, Excel, SPSS, SAS and the TI-83/84 Plus calculator can be used to find binomial probabilities.

### STATDISK

x	P(x)	P(x or fewer)	P(x or greater)
0	0.000977	0.000977	1.000000
1	0.014648	0.015625	0.999024
2	0.087891	0.103516	0.984375
3	0.263672	0.307188	0.896404
4	0.395508	0.702812	0.632812
5	0.237305	1.000000	0.237305

### MINITAB

x	P(x)
0	0.000977
1	0.014648
2	0.087891
3	0.263672
4	0.395508
5	0.237305

---

---

---

---

## Method 2: Using Technology

STATDISK, Minitab, Excel and the TI-83 Plus calculator can all be used to find binomial probabilities.

### EXCEL

	A	B
1	0	0.000977
2	1	0.014648
3	2	0.087891
4	3	0.263672
5	4	0.395508
6	5	0.237305

### TI-83 PLUS Calculator

L1	L2	L3	Z
0	9.8E-4	-----	
1	.01465	-----	
2	.08789	-----	
3	.26367	-----	
4	.39551	-----	
5	.23730	-----	
6	9.8E-4	-----

## Rationale for the Binomial Probability Formula

$$P(x) = \frac{n!}{(n-x)!x!} \cdot p^x \cdot q^{n-x}$$

  
 The number of outcomes with exactly  $x$  successes among  $n$  trials

3

---

---

---

---

---

---

---

---

---

---

## Binomial Probability Formula

$$P(x) = \frac{n!}{(n-x)!x!} \cdot p^x \cdot q^{n-x}$$

  
 Number of outcomes with exactly  $x$  successes among  $n$  trials

  
 The probability of  $x$  successes among  $n$  trials for any one particular order

---

---

---

---

---

---

---

---

---

---

## Recap

In this section we have discussed:

- ❖ The definition of the binomial probability distribution.
- ❖ Notation.
- ❖ Important hints.
- ❖ Three computational methods.
- ❖ Rationale for the formula.

---

---

---

---

---

---

---

---

## Examples

EX: 7, 9, 13, 15, 25, 30, 36

4

---

---

---

---

---

---

---

---

## Section 5-4 Mean, Variance, and Standard Deviation for the Binomial Distribution

---

---

---

---

---

---

---

---

## For Any Discrete Probability Distribution: Formulas

Mean  $\mu = \sum[x \cdot P(x)]$

Variance  $\sigma^2 = [\sum x^2 \cdot P(x)] - \mu^2$

Std. Dev  $\sigma = \sqrt{[\sum x^2 \cdot P(x)] - \mu^2}$

---

---

---

---

---

---

---

---

## Binomial Distribution: Formulas

Mean  $\mu = n \cdot p$

Variance  $\sigma^2 = n \cdot p \cdot q$

Std. Dev.  $\sigma = \sqrt{n \cdot p \cdot q}$

Where

$n$  = number of fixed trials

$p$  = probability of **success** in one of the  $n$  trials

$q$  = probability of **failure** in one of the  $n$  trials

5

---

---

---

---

---

---

---

---

## Interpretation of Results

It is especially important to interpret results. The **range rule of thumb** suggests that values are unusual if they lie outside of these limits:

Maximum usual values =  $\mu + 2 \sigma$

Minimum usual values =  $\mu - 2 \sigma$

---

---

---

---

---

---

---

---

## Recap

In this section we have discussed:

- ❖ Mean, variance and standard deviation formulas for any discrete probability distribution.
- ❖ Mean, variance and standard deviation formulas for the binomial probability distribution.
- ❖ Interpreting results.

---

---

---

---

---

---

---

---

## Examples

EX: 5, 9, 13, 17, 20

6

---

---

---
