

TUTORS MAY NOT HELP!!!

Exam #5: Chapters 10 - 11

Math 160, Section 7963

Spring 2010: Michael Orr

NAME _____

DUE: Tuesday, May 18, 2010

100 points. Show all work to receive full credit. You may use a calculator. CHECK YOUR WORK!!!!

Write down all formulas or calculator commands used to receive credit!!!!!!!!!!

1. (4 pts) Determine which plot shows the strongest linear correlation. Circle the letter of your choice.

A.

B.

C.

2. (5 pts) Given the linear correlation coefficient r and the sample size n , determine the critical values of r and use your findings to state whether or not the given r represents a significant linear correlation. Use a significance level of 0.05. JUSTIFY YOUR ANSWER!!!

$$r = -0.275, n = 15$$

3. (10 pts) A study was conducted to compare the average time spent in the computer lab each week versus course grade for computer programming students. The results are recorded in the table below.

Number of hours spent in lab	Grade (percent)
10	95
11	51
16	62
9	58
7	89
15	81
16	46
10	51

- A. Find the value of the linear correlation coefficient r . (Identify the steps used to determine this value).
- B. Based on the results from Part A, is there a significant linear correlation between the number of hours spent in the lab and the grade in the course? JUSTIFY YOUR ANSWER!!!

TUTORS MAY NOT HELP!!!

4. (10 pts) Based on the data from six students, the regression equation relating the number of hours of preparation (x) and the test score (y) is $\hat{y} = 67.3 + 1.07x$. The same data yield $r = 0.224$ and $\bar{y} = 75.2$. What is the best predicted test score for a student who spent 5 hours preparing for the test? Explain your reasoning.

5. (15 pts) Managers rate employees according to job performance and attitude. The results for several randomly selected employees are given below. (Assume that the first values are the x -values and the second are the y -values).

Performance	59	63	65	69	58	77	76	69	70	64
Attitude	72	67	78	82	75	87	92	83	87	78

- A. Use the given data to find the equation of the regression line. Round the final values to three significant digits, if necessary. (Identify the steps used to determine this value).

- B. Is there a significant linear correlation between performance and attitude? JUSTIFY YOUR ANSWER!!!

- C. Given a performance score of 72, what is the best prediction for attitude?

6. (14 pts) A company manager wishes to test a union leader's claim that absences occur on the different days of the week with the same frequencies. Test this claim at the 0.05 level of significance if the following sample data have been compiled.

Day	Mon	Tue	Wed	Thur	Fri
Absences	37	15	12	23	43

H_o : _____

H_1 : _____

Test statistic: _____

Critical value(s): _____

Null Hypothesis conclusion:

Conclusion on claim:

7. (14 pts) In studying the responses to a multiple-choice test question, the following sample data were obtained. At the 0.05 significance level, test the claim that the responses occur with the same frequency.

Response	A	B	C	D	E
Frequency	12	15	16	18	19

H_o : _____

H_1 : _____

Test statistic: _____

Critical value(s): _____

Null Hypothesis conclusion:

Conclusion on claim:

TUTORS MAY NOT HELP!!!

8. (14 pts) 160 students who were majoring in either math or English were asked a test question, and the researcher recorded whether they answered the question correctly. The sample results are given below. At the 0.10 significance level, test the claim that response and major are independent.

	Correct	Incorrect
Math	27	53
English	43	37

H_o : _____

H_1 : _____

Test statistic: _____

Critical value(s): _____

Null Hypothesis conclusion:

Conclusion on claim:

9. (14 pts) A researcher wishes to test the effectiveness of a flu vaccination. 150 people are vaccinated, 180 people are vaccinated with a placebo, and 100 people are not vaccinated. The number in each group who later caught the flu was recorded. The sample results are given below. Use a 0.05 significance level to test the claim that the proportion of people catching the flu is the same in all three groups.

	Vaccinated	Placebo	Control
Caught the flu	8	19	21
Did not catch the flu	142	161	79

H_o : _____

H_1 : _____

Test statistic: _____

Critical value(s): _____

Null Hypothesis conclusion:

Conclusion on claim:

BONUS (10 points)

The Department of Undergraduate Studies conducted a study to see if a student's graduating GPA affected their starting salary. The data collected were from a sample of recent graduates of the business department who graduated with a bachelor's degree in business. The regression equation describing the relationship was $Salary = 5.4181GPA + 15.315$ (Salary was recorded in thousands of dollars).

1. If a recent graduate that was not part of this study had a graduating GPA of 3.5, what would our regression line predict their starting salary to be?
a) \$18,963.35 b) \$101,941.55 c) \$35,522.00 d) \$34,278.35
e) None of the above. It's extrapolating to make this prediction

2. 81.43% of the variability in salary was explained by the relationship with GPA. What would the correlation between these 2 variables be?
a) 0.902 b) -0.902 c) 0.8143 d) -0.8143 e) 0.663 f) 9.024
